I have two tables, one containing data, and one containing some sort of identifier. A record can have multiple records in the identifier table. For instance: /* TBLB_DATA */ ------------- || id || name || ------------- 1 || abc || 1 || def || 2 || jkl || 2 || mno || 2 || rst || 3 || nus || 3 || fff || /* TBLB_IDENT */ ----------- || id || name || ----------- 1 || abc_1 || 1 || abc_2 || 2 || def_1 || 2 || def_2 || 3 || jkl_1 || 3 || jkl_2 || 3 || mno_1 || 3 || mno_2 || 3 || rst_1 || 3 || rst_2 || 3 || nus_1 || 3 || nus_2 || Basically, every record in the table that has a matching record in the identifier table, that record should be returned. The identifiers here are just sample data. For the identifier table, there can be multiple rows that share the same identifier. So a record with id 2 should be returned with name "def_1" as well as "def_2". A record with id 3 should be returned with names "jkl_1" and "jkl_2". However, a record with no matching identifier should be returned with no identifier (null). How can I write this query? A: select * from tableb_data
